

Website Building: CRUD

JavaScript – node js todo app

The following exercise contains the following subjects:

- ◆ CRUD

Instructions

Lets create a simple todo app with no UI.

Create an empty array which you will add your todo items.

Create simple functions that will do the following:

- * Add item (id, task name, isCompleted)
- * Delete item
- * Mark as done
- * Unmark as done
- * List – returns all the items with their status. Done items should be at the bottom of the list.

We will learn about testing tomorrow and test these functions out.
